

Web Development Screening Task

Deepwoods Initiatives on Environment Trust

Green Positive® | Sustainably Yours®

Role	Web Developer (Fresher / 0 - 1 yr)
Task Duration	1 to 1.5 hours
Submission	GitHub repository link only
Tools Allowed	Anything - AI tools, libraries, frameworks, open source
Evaluation	Quality of output and speed!

Overview

You will build a two-page website for a fictional sustainability company called EcoNova Materials Pvt. Ltd. The two pages are:

1. An ESG Dashboard page that displays live data from a provided JSON file as charts and KPI cards.
2. A Careers page with job listings, an application form, and resume upload - with form data stored to a free cloud backend (Supabase).

You are free to use any tools, AI assistants, frameworks, or libraries. There is no restriction. What matters is that the final result looks polished, works correctly, and is submitted as a GitHub repository.

Page 1 - ESG Dashboard

1.1 The Data Source

The dashboard must read data from the following JSON. You can either:

- Host the JSON on a free service like JSONbin.io or GitHub Gist and fetch it via API, OR
- Include it as a local esg_data.json file in your repo and import it directly

Either approach is acceptable. No marks difference between the two.

Mock ESG JSON - EcoNova Materials Pvt. Ltd.

Copy this exactly into your project

```
{  "company": "EcoNova Materials Pvt. Ltd.",  "unit": "Metric Tonnes CO2e / kWh / kL",  "monthly_data": [    { "month": "Oct 2024", "ghg_emissions": 42.3, "energy_kwh": 18400, "water_kl": 310, "waste_kg": 1250 },    { "month": "Nov 2024", "ghg_emissions": 45.1, "energy_kwh": 19200, "water_kl": 295, "waste_kg": 1180 },    { "month": "Dec 2024", "ghg_emissions": 50.8, "energy_kwh": 21500, "water_kl": 340, "waste_kg": 1420 },    { "month": "Jan 2025", "ghg_emissions": 47.6, "energy_kwh": 20100, "water_kl": 320, "waste_kg": 1300 },    { "month": "Feb 2025", "ghg_emissions": 43.9, "energy_kwh": 18900, "water_kl": 285, "waste_kg": 1150 },    { "month": "Mar 2025", "ghg_emissions": 39.2, "energy_kwh": 17300, "water_kl": 270, "waste_kg": 1080 }  ],  "targets": {    "ghg_annual_tco2e": 250,    "energy_annual_kwh": 115000,    "water_annual_kl": 1800,    "waste_annual_kg": 7000  },  "scope_breakdown": {    "scope1_percent": 38,    "scope2_percent": 52,    "scope3_percent": 10  },  "certifications": ["ISO 14001:2015", "GreenCo Silver", "BRSR Compliant"]}
```

1.2 Required KPI Cards

Display the following 4 KPI cards prominently at the top of the dashboard. Each card must show the current value (sum of all 6 months), the annual target, and a progress indicator (e.g. a small progress bar or percentage).

GHG Emissions tCO2e (6-month total vs. 250 tCO2e annual target)	Energy Consumed kWh (6-month total vs. 115,000 kWh annual target)	Water Used kL (6-month total vs. 1,800 kL annual target)	Waste Generated kg (6-month total vs. 7,000 kg annual target)
---	---	--	---

1.3 Required Charts

Build the following 3 charts below the KPI cards. Use any charting library you prefer (Chart.js, Recharts, ApexCharts, etc.).

#	Chart Name	Data to Use	Chart Type
1	Monthly GHG Trend	ghg_emissions across all 6 months (X: month, Y: tCO2e)	Line chart
2	Monthly Energy & Water	energy_kwh and water_kl across 6 months as two series	Bar chart (grouped)
3	GHG Scope Breakdown	scope1_percent, scope2_percent, scope3_percent from scope_breakdown	Donut / Pie chart

Tip: The certifications array can be displayed as badges or tags on the dashboard for a nice touch, but this is optional.

Page 2 - Careers Portal

2.1 Job Listings

Display the following 3 job openings as cards or a listing. Each listing must show the role title, team, location, and a short description.

Role Title	Team	Location	Short Description
Sustainability Analyst	Consulting	Bengaluru (Hybrid)	Assist clients with GHG data collection, emissions calculations, and sustainability reporting under GRI and BRSR frameworks.
Web Developer	Product & Tech	Bengaluru (Hybrid)	Build and maintain the Green Positive platform. Work with Zoho Creator, dashboards, and client-facing portals.
ESG Research Intern	Research	Remote	Support the team in ESG data analysis, framework mapping, and client report preparation. 3-month paid internship.

2.2 Application Form

Below the job listings, include an application form with the following fields exactly:

#	Field Label	Input Type	Required?
1	Full Name	Text input	Yes
2	Email Address	Email input	Yes
3	Phone Number	Number / tel input	Yes
4	Role Applying For	Dropdown (3 job titles above)	Yes
5	LinkedIn Profile	URL input	No (optional)
6	Why do you want to join?	Textarea (max 300 characters)	Yes
7	Upload Resume	File upload (.pdf or .docx only)	Yes

2.3 Backend Storage - Supabase

Form submissions must be stored in a Supabase free-tier project. Here is exactly what they need to do:

3. Go to supabase.com and create a free account.
4. Create a new project.
5. Create a table called applications with columns: id (auto), name, email, phone, role, linkedin, message, resume_url, submitted_at.
6. Enable Supabase Storage, create a bucket called resumes, and upload the resume file there on form submission.
7. Store the public URL of the uploaded resume in the resume_url column alongside the other form data.
8. On successful submission, show a confirmation message to the user. No page reload.

Note: They will need to add their Supabase project URL and anon key as environment variables. They should include a .env.example file in the repo (not the actual .env).

Technical Requirements

3.1 What Must Work

- Dashboard page loads and renders all 4 KPI cards correctly from the JSON data
- All 3 charts render with the correct data and are labelled clearly
- Careers page shows all 3 job listings
- Application form validates required fields before submission
- Resume upload accepts only .pdf or .docx files
- Form data (including resume URL) is saved to Supabase on submit
- A success message is shown after successful submission
- Both pages are accessible from a navigation bar or header

3.2 Design Expectations

- Clean, professional layout, it should not look like a bare HTML page
- Consistent color scheme across both pages
- Mobile-responsive or at minimum readable on a laptop screen
- Charts should have titles and axis/legend labels

3.3 Repository Requirements

- Code pushed to a public GitHub repository

- README.md must include: project description, setup steps and how to run locally.
- .env.example file included (no real credentials in the repo)
- Folder structure should be reasonably organized, not all files dumped in root

Submission

Share the GitHub repository link with us. That is all.

Make sure the repository is public so we can access it without requesting permissions.

Deployment to Vercel, Netlify, or similar is not required but will be noticed positively.
